

ID2207 Modern Methods in Software Engineering, Project

--- How to Deploy & Run **iAd** (jRuby on Rails, JDK 5.0+ required) ---

1. Find **iad_production.sql** in the same director as this readme.txt file, and import it to your local MySQL server (which creates a new database named iad_production)

```
mysql -u root -p < iad_production.sql
```

2. Deploy **iad.war** to your J2EE server. Take Tomcat as an example, simply copy iad.war to %TOMCAT_HOME%\webapps, then launch Tomcat, you will get an exploded folder %TOMCAT_HOME%\webapps\iad

3. Edit the database configuration file %TOMCAT_HOME%\webapps\iad\config\database.yml, in the production section, make sure the database is iad_production, and username and password match your local MySQL administrator setting

```
production:  
  adapter: mysql  
  database: iad_production  
  username: root  
  password:  
  host: localhost
```

4. Navigate web browser to <http://localhost:8080/iad/>, you will see the login page.

Sample accounts:

Role	Username	Password
Root	root	root
Director	sikeh	sikeh
Director	shanbo	shanbo
Director	leifl	leifl
Client	kth	kth
Client	ericsson	ericsson
Client	google	google
Staff	hiro	hiro
Staff	ando	ando
...

If you encounter any problem, please contact us:
